Payment Processing

The best-in-class digital payment processing system.

Digital Payment Processing will automate the data entry of account receivables through the use of a desktop check scanner and software that captures information from payment coupons and checks.

Time is money ... automate it.

How does it work? The checks and payment coupons are stacked by transaction and fed through the scanner for imaging and information capture. The system uses MICR, CAR/LAR amount recognition, ICR, OCR, and/or Barcode to recognize data and populate the data entry fields. These transactions are then balanced (over/under payments) and exported into files formatted for importing into your account receivables system and for electronic depositing to your bank.

MI Payment Processing can manage transactions of all types— 1 coupon with 1 check, many coupons with 1 check, 1 coupon with many checks, all checks, or all coupons. Multiple payment coupons can be defined. MI Payment Processing has advanced product features such as detecting check boxes, comparing fields, verifying presence of data in fields, and invoking actions based on information read. If there is information on the payment coupon, **MI Payment Processing** interprets the data and takes action based on the defined requirements.

If your business uses payment coupons, you can benefit. Whether you are a government agency, utility, insurance, credit card or property management company, medical or dental office, service company or any type of business that hand or batch posts, we can demonstrate an affordable, quick, and easy solution to significantly reduce the time and costs associated with payment processing.
